Rice blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous assomycete with
a haploid genome (la-7) of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fingal-host interaction. In
order to facilitate genome wide analysis, a BAC library
containing 9216 clones with an average insert size of 130
kbp was constructed. This library represents greater
than 25X genome coverage. High density colony filters
are available upon request." 2 others

                                                                                                                                                                                                                                                               The present sequence encodes human vascular endothelial growth factor-2 (VEGF-2). The VEGF-2 polypeptides have activities similar to VEGF-2 polypeptides stimulate and chelial cells, vEGF-2 polypeptides stimulate and consist calls, stimulate endothelial cell migration, stimulate angiogenesis, decrease blood pressure, and increase blood flow. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating a medical condition. The VEGF-2 polypeptides or polymucleotides may be useful in treating deficiencies or disorders of the immune system, by cuseful in treating deficiencies or disorders of immune cells. The etology of these immune deficiencies or disorders may be genetic, somatic, such as cancer or some ceficiencies or disorders, acquired (e.g. by chemotherapy or toxins), or mobilization (chemotaxis) of immunologic deficiency syndromes include blood protein disorders, ataxia telangiectasia, common variable immunodeficiency, Digeorge syndrome, lymphopenia, phagocyte adhesion deficiency syndrome, lymphopenia, phagocyte chericidal dysfunction, severe combined immunodeficiency (SCIDs), wiskott-Aldrich disorder, anemia, thrombocytopenia, or hemoglobinuria. They can also be used to modulate emostatic or thrombolytic activity: similarly allergic reactions and conditions such as asthma (particularly allergic asthma) or other respiratory problems, may also be treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

This sequence encodes vascular endothelial growth factor-B (VEGF-B),
which is an angiogenic protein of the invention. The angiogenic proteins
and the DNA sequences encoding them, are used to prevent, treat or
ameliotate disease and to detect diseases, or susceptibility, by
centecting mutations or the presence or amount of angiogenic protein
contecting mutations or the presence or amount of angiogenic protein
contecting mutations or the presence or amount of angiogenic protein
contecting material disease, critical limb ischaemia or coronary disease.
Contipheral arterial disease, critical limb ischaemia or coronary disease.
Contagonists of the sequences are used to inhibit angiogenesis in tumours
and to treat inflammation (where associated with increased vascular
contagonists are also useful for stimulating (lymph) angiogenesis. The
Agonists are also useful for stimulating (lymph) angiogenesis.
Conterapeutic agents) and to raise antibodies. The antibodies are useful as
therapeutic agents) and to raise antibodies. The artibodies are useful
conterpring of colls, for detection, purification and targeting of
therapeutic progenitor/stem cells. It is also contemplated that the
contemplates might be useful for treating a very wide range of other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated mucleic acid comprising pVGI.1 expression vector construct containing the vascular endothelial growth factor 2 (VEGF-2) insert. The mucleic acid is useful for producing a host cell by transducing, transforming or transfecting a host cell with the DNA and for treating a patient having chronic limb ischaemia or ucidmune myocardial ischaemia, or a disease or disorder selected from autoimmune disorders (e.g. rheumatoid arthritis, dermaticis), allergic reactions or conditions (e.g. crohn's disease), hyperproliferative disorders (e.g. duscher's disease), diseases due to viral, batterial, fungal or parasitic infection, cardiovascular disorders (e.g. cardiomyopathy), arrhythmia, heart valve diseases, aneurysms, atterial occlusive disorders and embolism. New isolated polynucleotide encoding an antibody which inhibits a VEGF-2 polypeptide, useful for diagnosing, treating or preventing diseases associated with aberrant VEGF-2 expression or function, e.g. cancer or inflammation.

Disclosure, Fig 1, 425pp, English.

The invention relates to an isolated polynucleotide encoding a first antibody at least 95-100% identical to a second antibody comprising an amino acid sequence selected from at least one, two or three CDR region(8) of a VH or VL domain where the first antibody or three CDR immunospecifically inhibits a VEGF-2 polypeptide. The isolated polynucleotide is useful in diagnosing, treating preventing, prognosing, aneliorating or monitoring diseases associated with aberrant VEGF-2 or VEGF-

This invention describes a novel isolated polymucleotide encoding a first antibody comprising an amino acid sequence selected from at least one, two or three complementarity determining (CDR) region(s) of a VH and/or U. Ondain of a second antibody that immunospecifically binds to a vascular endothelial growth factor (VBGF)-2 polypeptide. The products of the invention have cytostatic, cardiovascular, antirhemmatory, antiarhitic, antidabetic, ophthalmological, antimizammatory, antiarhitic, antidabetic, ophthalmological, antimizammatory, antiarhitic, antidabetic, ophthalmological, antiproviation actually. The polymucleotide is useful in diagnosing, cardiant, antialleragic, immunosuppressive, dermatological and antipsoriation actually. The polymucleotide is useful in diagnosing, treating, preventing, prognosing, ameliorating or monitoring diseases usociated with aberrant VBGF-2 or VBGF-2 receptor expression or lack of VBGF-2 or VBGF-2 receptor function, such as cancer and other profiterative disorders, cardiovascular disorders (arrhythmiss), offerious diseases, autoimmune diseases (e.g. rheumatoid arthritis, systemic Lupus Brythematosus, allergies), diabetic retinopathy or the invention may also be used to stimulate angiogenesis, wound healing, and promoting vascular tissue repair. The polymucleotide and polypeptide and promoting vascular tissue repair. The polymucleotide and polypeptide may also be used to stimulate angiogenesis, wound healing, and promoting vascular tissue repair. The polymucleotide and polypeptide of may also be used for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors and for the production of diagnostics and therapeutics e.g. gene therapy and in vaccines to treat

The invention relates to vascular endothelial growth factor (VEGF)-2 antibodies are useful for treating, preventing or amalibodies. VEGF-2 antibodies are useful for treating, preventing or disorders, such as inflammatory diseases or disorders, proliferative disorders, tumours, tumour metastasis, breast cancer, brain cancer, prostate cancer, colon cancer. Implandation, an infectious disease, Kaposi's sarcoma, an autoimmune disease, rheumatoid arthritis, psoriasis, diabetic retinopathy, a disease or disorder associated with the lack of VEGF-2 (receptor) function. The disorder associated with the lack of VEGF-2 (receptor) function. The monitoring cancers and other hyperproliferative disorders. VEGF-2 is also used in gene therapy. The present sequence is human VEGF-2 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

                                                                                                                                                                                                                                                                                                                                                                                            endothelial growth factor (VEGF)-related protein (VPP) (AAM13833), a protein that binds to, and stimulates the phosphorylation of, the protein that binds to, and stimulates the phosphorylation of, the excracellular domain of the Flt4 receptor and the For region of the IgG heavy chain was expressed in 293 cells and used to screen for membranelinked VRP by fluorescent-activated cell sorting. A positive cell line, glioma 661, was identified and a cDNA library from it was screened with probes (see also AATS9931-22) based on an EST sequence (AATS9930) sequence similar to VEGF to obtain clone VHI.4. The clone can be used to produce recombinant VRF, and diagnostically for tissue-specific typing
                                                                                                                                                                                                                                                                                            protein similar to vascular endothelial growth factor - used to e.g. wounds, tumours, rheumatoid arthritis, Kaposi's sarcoma etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CGCTGCTCCCGGGTCCTCGCGAAGGCGCCGCCGCCGCCGGCCTTCGAGTCCGGAACTCG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA clone codes for human VEGF-C (AAW00932), a novel ligand that binds specifically to human Flt4 receptor tyrosine kinase (VEGFR-3), etimulating phosphorylation of the receptor, and which can be used to modulate growth of endothelial cells and for diagnosis of endothelial cell diseases. The clone was isolated from a PC-3 prostatic adenocarcinoma cell (AYCC CRL 1435) CDNA library by PCR amplification and has been cloned into pcDNAI to form plasmid pFLT4-L (ATCC 97231). The human VEGF-C gene is located on chromosome 4q34 and contains 6 introns (see AAT84303-14). The insert from the human clone was used to isolate mouse (see AAT84277) and quail (see AAT84300) VEGF-C sequences. It can also be used to produce recombinant VEGF-C polypeptides in host cells and to provide probes for screening endothelial cell diseases. Antisense concluse that block the receptor can be used to control endothelial cell proliferation, e.g. lymphangioma or metastatic cancer. The promoter sequence (AAT84278) is also claimed

The vascular endothelial growth factor C (VEGF-C) polypeptides have activities affecting growth and migration of vascular endothelial cells, promoting growth of lymphatic endothelial cells and lymphatic vessels, increasing yeacular permeability, and affecting myelopoiesis. The products can be used for stimulating angiogeneses, for inhibiting angiogenesis, for stimulating lymphangiogeneses, for inhibiting of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used for modulate myelopoiesis, e.g. treating granulocytopenia. They can also be used for modulating the growth of endothelial cells. They can also be used to stimulate lymphocyte production and maturation, and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GGCTGCTCCCGGGTCCTCGCGAGGCGCCCGCCGCCGCCGCCGCCTTCGAGTCCGGACTCG

VEGF-C has the ability to stimulate re-endothelialisation of an injured blood vessel, without significant stimulation of smooth muscle cell proliferation. It can bind to and stimulate VEGFR-2 (vessular endothelial growth factor receptor) and/or VEGFR-3 phosphorylation in cells that express such receptors. An anti-restenosis agent comprising either a VEGF-C gene or protein is used in a method to reduce or prevent restenosis and stenoais of a blood vessel following vascular trauma e.g., cardiovascular surgery and percutaneous transluminal coronary angioplasty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= e
